# DESCRIPTION

## Library Management System in Java using AWT & Swing

A Library Management System (LMS) helps libraries efficiently handle book records, student transactions, and borrowing processes. Implementing this system in Java using AWT & Swing ensures an interactive graphical user interface (GUI), improving user experience and operational efficiency.

### Project Overview

The Library Management System consists of multiple modules designed to automate book handling, streamline student registration, and manage loans and returns seamlessly. The system interacts with a MySQL database via JDBC, ensuring structured data management.

### Key Features

1. Login System – Provides authentication for librarians, students, and administrators, ensuring secure access.
2. Database Connection (MySQL) – Stores book details, student information, and transaction logs.
3. Loading Page – Displays a graphical loading screen while data is being processed.
4. Student Registration – Allows students to enroll in the system by providing essential details such as name, ID, and contact information.
5. Home Page – Serves as the central dashboard, providing navigation options for various functions.
6. Book Management – Enables librarians to add, update, and remove book records.
7. Issue & Return Books – Handles book lending, tracks due dates, and calculates fines for late returns.
8. Error Handling (Try & Catch) – Ensures smooth functionality by detecting and managing system failures, such as database errors or incorrect input.

### Implementation Details

- AWT (Abstract Window Toolkit) : Provides core UI components such as windows, buttons, and labels.
- Swing : Enhances AWT with modern UI features, including responsive components like `JFrame`, `JButton`, `JLabel`, and `JTable`.
- JDBC (Java Database Connectivity) : Facilitates communication between Java and MySQL, enabling data retrieval and manipulation.

- Exception Handling (Try & Catch) : Prevents system crashes by capturing and managing errors gracefully.

### **Functionality Breakdown**

#### **1. User Authentication**

- Ensures only authorized users access the system.
- Validates credentials against stored database records.

#### **2. Book Management**

- Allows librarians to maintain book details such as title, author, category, and publication year.
- Supports searching books by title or author.

#### **3. Student Registration & Management**

- Students can register by entering personal details.
- The system maintains student borrowing history.

#### **4. Issuing & Returning Books**

- Books can be issued with automated due date tracking.
- Late returns incur fines based on predefined rules.

#### **5. System Logs & Reports**

- Generates reports on issued books, returned books, and overdue transactions.
- Maintains librarian activity logs for administrative oversight.

### **Advantages of Using Java, AWT & Swing**

- Platform Independence : Java allows the system to run on different operating systems without modification.
- User-Friendly GUI : Swing provides an intuitive and visually appealing interface.
- Efficient Database Handling : JDBC ensures seamless interaction with MySQL for storing and retrieving records.
- Robust Error Handling : The try-and-catch mechanism prevents system failures and enhances stability.
